5HT_{2C} AND 5HT_{2B} ANTAGONISTS

This invention relates to compounds having pharmacological activity, processes for their preparation, to compositions containing them and to their use in the treatment of CNS disorders.

WO 94/04533 (SmithKline Beecham plc) describes indole and indoline derivatives which are described as possessing 5HT_{2C} receptor antagonist activity. A structurally distinct class of compounds has now been discovered, which have been found to have 5HT_{2C} receptor antagonist activity. Some or all of the compounds of the invention also exhibit 5HT_{2B} antagonist activity. 5HT_{2C/2B} receptor antagonists are believed to be of potential use in the treatment of CNS disorders such as anxiety, depression, epilepsy, obsessive compulsive disorders, migraine, Alzheimers disease, sleep disorders, feeding disorders such as anorexia and bulimia, panic attacks, withdrawal from drug abuse such as cocaine, ethanol, nicotine and benzodiazepines, schizophrenia, and also disorders associated with spinal trauma and/or head injury such as hydrocephalus. Compounds of the invention are also expected to be of use in the treatment of certain GI disorders such as IBS as well as microvascular diseases such as macular oedema and retinopathy.

 1-(6-(4-Pyridyl)-3-indolylcarbonyl)-5-methoxy-6-trifluoromethyl indoline,

- 30 and pharmaceutically acceptable salts thereof.

The compounds of the formula (I) can form acid addition salts with acids, such as conventional pharmaceutically acceptable acids, for example maleic, hydrochloric, hydrobromic, phosphoric, acetic, fumaric, salicylic, citric, lactic, mandelic, tartaric and methanesulphonic. Quaternary salts of intermediate compounds in which P is an

aromatic group such as pyridyl can also be prepared with C₁₋₆alkylating agents, for example methyl iodide, and such salts also form an aspect of the invention.

Compounds of formula (I) may also form N-oxides or solvates such as hydrates, and the invention also extends to these forms. When referred to herein, it is understood that the term 'compound of formula (I)' also includes these forms.

Certain compounds of formula (I) are capable of existing in stereoisomeric forms including enantiomers and the invention extends to each of these stereoisomeric forms and to mixtures thereof including racemates. The different stereoisomeric forms may be separated one from the other by the usual methods, or any given isomer may be obtained by stereospecific or asymmetric synthesis. The invention also extends to any tautomeric forms and mixtures thereof.

The present invention also provides a process for the preparation of a compound of formula (I) or a pharmaceutically acceptable salt thereof, which process comprises:

(a) the coupling of a compound of formula (II);

(II)

with a compound of formula (III);

(III)

wherein R¹⁶ and R¹⁷ contain the appropriate functional group(s) necessary to form a bond when coupled, A, B, C, D and P are as defined in formula (I), E is as defined in formula (I) or is a group NR^{1'} and the variables, R^{1'}, R^{2'}, R^{3'} and R^{4'} are R¹, R², R³ and R⁴ respectively, as defined in formula (I), or groups convertible thereto, and thereafter optionally and as necessary and in any appropriate order, converting any R^{1'}, R^{2'}, R^{3'} and R^{4'}, when other than R¹, R², R³ and R⁴ respectively to R¹, R², R³

and R⁴, interconverting R¹, R², R³ and R⁴ and forming a pharmaceutically acceptable salt thereof, or

(b) coupling a compound of formula (IV):

(IV)

wherein P, A, B, C, D, E, R^{2'} and R^{3'} are as defined above and L is a leaving group
10 with a compound of formula (V):

wherein R^{4'} is as defined above and thereafter optionally and as necessary and in any
15 appropriate order, converting any R^{1'}, R^{2'}, R^{3'} and R^{4'}, when other than R¹, R², R³
and R⁴ respectively to R¹, R², R³ and R⁴, interconverting R¹, R², R³ and R⁴ and
forming a pharmaceutically acceptable salt thereof.

Preferably R¹⁷ is a leaving group such as halogen and in particular bromo.

Preferably R¹⁶ is a boronic acid group. Compounds of formula (II) and (III) are reacted together using standard boronic acid coupling conditions in the presence of an organometallic catalyst. Preferred catalysts are palladium catalysts, in particular tetrakis (triphenylphosphine) palladium(0).

For process (b) L is a leaving group such as halogen, in particular chloro. Compounds of formula (IV) and (V) can be reacted together using standard reaction conditions known in the art.

R¹ to R³ groups can be introduced at any suitable stage in the process, preferably R¹ to R³ groups are introduced at an early stage in the process. It should be appreciated that it is preferred that all groups R¹ to R³ are introduced before coupling compounds of formula (II) and (III).

Suitable examples of groups R¹, R²' and R³' which are convertible to R¹, R² and R³ alkyl groups respectively, include acyl groups which are introduced conventionally and may be converted to the corresponding alkyl group by conventional reduction, such as using sodium borohydride in an inert solvent followed

by hydrogenolysis in an inert solvent. Hydrogen substituents may be obtained from alkoxy carbonyl groups which may be converted to hydrogen by hydrolysis and decarboxylation.

Interconversions of R^1 , R^2 and R^3 are carried out by conventional procedures. For example halo groups can be introduced by selective halogenation of the ring P or the benzene ring of the indoline group using conventional conditions. It should be appreciated that it may be necessary to protect any R^1 to R^3 hydrogen variables which are not required to be interconverted.

Suitable protecting groups and methods for their attachment and removal are conventional in the art of organic chemistry, such as those described in Greene T.W. 'Protective groups in organic synthesis' New York, Wiley (1981).

Compounds of formula (II), (III), (IV) and (V) may be prepared according to known methods or analogous to known methods.

Novel intermediates of formula (III) and (IV) also form part of the invention. Pharmaceutically acceptable salts may be prepared conventionally by reaction with the appropriate acid or acid derivative. N-oxides may be formed conventionally by reaction with hydrogen peroxide or percarboxylic acids.

Compounds of formula (I) and their pharmaceutically acceptable salts have 5HT_{2B/2C} receptor antagonist activity and are believed to be of potential use for the treatment or prophylaxis of CNS disorders such as anxiety, depression, epilepsy, obsessive compulsive disorders, migraine, Alzheimers disease, sleep disorders, feeding disorders such as anorexia and bulimia, panic attacks, withdrawal from drug abuse such as cocaine, ethanol, nicotine and benzodiazepines, schizophrenia, and also disorders associated with spinal trauma and/or head injury such as hydrocephalus. Compounds of the invention are also expected to be of use in the treatment of certain GI disorders such as IBS as well as microvascular diseases such as macular oedema and retinopathy.

Thus the invention also provides a compound of formula (I) or a pharmaceutically acceptable salt thereof, for use as a therapeutic substance, in particular in the treatment or prophylaxis of the above disorders.

The invention further provides a method of treatment or prophylaxis of the above disorders, in mammals including humans, which comprises administering to the sufferer a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt thereof.

In another aspect, the invention provides the use of a compound of formula (I) or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for the treatment or prophylaxis of the above disorders.

The present invention also provides a pharmaceutical composition, which comprises a compound of formula (I) or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

5 A pharmaceutical composition of the invention, which may be prepared by admixture, suitably at ambient temperature and atmospheric pressure, is usually adapted for oral, parenteral or rectal administration and, as such, may be in the form of tablets, capsules, oral liquid preparations, powders, granules, lozenges, reconstitutable powders, injectable or infusable solutions or suspensions or suppositories. Orally administrable compositions are generally preferred.

10 Tablets and capsules for oral administration may be in unit dose form, and may contain conventional excipients, such as binding agents, fillers, tableting lubricants, disintegrants and acceptable wetting agents. The tablets may be coated according to methods well known in normal pharmaceutical practice.

15 Oral liquid preparations may be in the form of, for example, aqueous or oily suspension, solutions, emulsions, syrups or elixirs, or may be in the form of a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, emulsifying agents, non-aqueous vehicles (which may include edible oils), preservatives, and, if desired, conventional flavourings or colourants.

20 For parenteral administration, fluid unit dosage forms are prepared utilising a compound of the invention or pharmaceutically acceptable salt thereof and a sterile vehicle. The compound, depending on the vehicle and concentration used, can be either suspended or dissolved in the vehicle. In preparing solutions, the compound can be dissolved for injection and filter sterilised before filling into a suitable vial or ampoule and sealing. Advantageously, adjuvants such as a local anaesthetic, preservatives and buffering agents are dissolved in the vehicle. To enhance the stability, the composition can be frozen after filling into the vial and the water removed under vacuum. Parenteral suspensions are prepared in substantially the same manner, except that the compound is suspended in the vehicle instead of being
25 dissolved, and sterilization cannot be accomplished by filtration. The compound can be sterilised by exposure to ethylene oxide before suspension in a sterile vehicle. Advantageously, a surfactant or wetting agent is included in the composition to facilitate uniform distribution of the compound.

35 The composition may contain from 0.1% to 99% by weight, preferably from 10 to 60% by weight, of the active material, depending on the method of administration.

The dose of the compound used in the treatment of the aforementioned disorders will vary in the usual way with the seriousness of the disorders, the weight

of the sufferer, and other similar factors. However, as a general guide suitable unit doses may be 0.05 to 1000 mg, more suitably 0.05 to 70.0 mg, for example 0.2 to 5 mg; and such unit doses may be administered more than once a day, for example two or three a day, so that the total daily dosage is in the range of about 0.5 to 100 mg; and
5 such therapy may extend for a number of weeks or months.

When administered in accordance with the invention, no unacceptable toxicological effects are expected with the compounds of the invention.
